Team Member 5 : Devi Reddy Venkata Keerthana Reddy

College : MLR Institute Of Technology (MLRIT), Hyderabad

Problem Summary

Rapid urbanization and increasing vehicle density have made traffic management one of the most critical challenges faced by modern cities. Traffic incidents such as road accidents, signal failures, vehicle breakdowns, infrastructure damage, public events, and adverse weather conditions can quickly disrupt transportation networks, causing severe congestion, delays in emergency response, economic losses, and risks to public safety.

Currently, multiple agencies including Traffic Police, Public Transport Authorities, Emergency Medical Services, Fire Departments, Municipal Maintenance Teams, and Traffic Control Centers operate using independent systems with limited coordination. Incident information is often communicated through phone calls, emails, or isolated applications, leading to delayed decision-making and inefficient resource utilization.

Public transport services are also significantly affected during major incidents, with buses and metro services experiencing route disruptions and schedule delays. Citizens have limited visibility into real-time traffic conditions and often receive delayed or inconsistent updates regarding diversions and emergency situations.

A centralized, intelligent, and collaborative platform is therefore essential to streamline incident management, improve inter-agency coordination, enhance citizen communication, and enable faster, data driven operational decisions.

Why This Challenge Matters

Efficient traffic management is fundamental to the functioning of a smart city. Delays in responding to traffic incidents can lead to:

- Increased road congestion and travel time.
- Delayed emergency response for ambulances, police, and fire services.
- Disruptions to public transport operations.
- Higher fuel consumption and environmental pollution.
- Increased operational costs for city authorities.
- Reduced public safety and citizen satisfaction.
- Limited visibility for decision-makers due to fragmented information.

An integrated digital platform can significantly improve operational efficiency, reduce incident response times, and enhance the overall transportation experience for both authorities and citizens.

Existing Challenges

Current traffic management systems face several operational limitations:

- **Fragmented Communication:** Agencies rely on disconnected communication channels, resulting in slow information sharing and coordination.
- **Manual Incident Handling:** Most incidents require manual assessment, prioritization, and dispatch, increasing response times.
- **Lack of Unified Visibility:** Traffic operators and city administrators do not have a centralized view of incidents, resources, and infrastructure status.
- **Inefficient Public Transport Coordination:** Bus route diversions and service updates are often managed manually, causing delays and confusion.
- **Limited Citizen Engagement:** Citizens lack a single platform to report incidents, monitor request status, or receive timely notifications.
- **Reactive Infrastructure Maintenance:** Traffic signals and road infrastructure are generally maintained after failures occur rather than through predictive maintenance.

- **Insufficient Data Analytics:** Existing systems provide limited insights into traffic patterns, recurring incident hotspots, and operational performance.

Objectives

The primary objective of this project is to develop an AI-powered Urban Traffic Operations Management Platform on the ServiceNow platform that:

- Centralizes traffic incident reporting and management.
- Enables seamless coordination among multiple government agencies.
- Automates incident assessment, prioritization, and workflow orchestration.
- Supports intelligent public transport disruption management.
- Improves citizen engagement through a unified self-service portal.
- Enhances traffic infrastructure monitoring and preventive maintenance.
- Provides real-time operational dashboards and analytics for city leadership.

Proposed Solution

UrbanSync - One City. One Platform. Endless Mobility.

UrbanSync is a centralized urban traffic operations platform built on ServiceNow that enables real-time coordination between Traffic Police, Transport Authorities, Road Maintenance, Emergency Services, and Public Transport operators during traffic incidents. The platform consolidates incident reports from citizens, CCTV systems, traffic sensors, and field officers into a single command workspace. Using intelligent workflow automation, it automatically dispatches the appropriate agencies, initiates bus route diversions, tracks traffic signal failures, assigns maintenance teams, and provides real-time status updates to both citizens and city officials. By replacing fragmented communication with a unified operational platform, UrbanSync reduces response time, minimizes traffic congestion, improves public safety, and enhances overall city mobility.

Solution Overview

UrbanSync is a centralized ServiceNow-powered Smart City Traffic Operations Platform designed to transform how metropolitan cities detect, manage, and resolve traffic incidents. The platform unifies traffic management authorities, emergency response agencies, public transport operators, infrastructure maintenance teams, and citizens into a single collaborative ecosystem.

The solution enables real-time incident reporting, AI-assisted incident assessment, intelligent workflow automation, and seamless coordination among multiple agencies. By leveraging ServiceNow's App Engine Studio, Flow Designer, Major Incident Management, CMDB, Performance Analytics, Service Portal, Virtual Agent, and Generative AI, UrbanSync ensures faster response times, improved operational efficiency, and enhanced public safety.

Rather than reacting to incidents after they occur, the platform proactively supports decision-makers through predictive insights, automated task orchestration, and real-time situational awareness.

Solution Objectives

UrbanSync is designed to achieve the following objectives:

- Centralize all traffic incidents into a unified command platform.
- Enable real-time collaboration among multiple government agencies.
- Automate incident prioritization and response workflows.

- Improve emergency response coordination.
- Minimize traffic congestion through intelligent rerouting.
- Enhance public transport disruption management.
- Improve citizen engagement and transparency.
- Monitor traffic infrastructure health and maintenance.
- Provide data-driven insights for city leadership.

Key Stakeholders

- **Traffic Management Centre (TMC)** – Central command for monitoring and coordinating traffic incidents.
- **Traffic Police** – Manage traffic flow, diversions, and emergency response.
- **Transport Commissioner** – Oversees city-wide operations through real-time dashboards.
- **Public Transport Authority** – Coordinates bus and rail route diversions during disruptions.
- **Road Maintenance Team** – Repairs damaged roads and clears incident sites.
- **Traffic Signal Maintenance Team** – Maintains and restores traffic signal infrastructure.
- **Ambulance & Emergency Services** – Respond to accidents and medical emergencies.
- **Field Officers** – Update incident progress and maintenance status using mobile devices.
- **Citizens & Commuters** – Report incidents and receive live traffic updates.

Solution Workflow

UrbanSync follows an end-to-end incident management workflow that enables seamless coordination between citizens, emergency services, transport authorities, and city administrators. Incidents are captured through multiple reporting channels, intelligently analyzed, and routed to the appropriate agencies using automated ServiceNow workflows. Throughout the incident lifecycle, real-time status updates, mobile-enabled field operations, and executive dashboards ensure efficient resource allocation, faster resolution, and enhanced public safety, creating a unified and intelligent traffic management ecosystem.

Innovation

UrbanSync transforms traditional traffic management into an intelligent, proactive, and collaborative Smart City Operations Platform by combining AI-driven decision support, workflow automation, and real-time coordination across multiple agencies.

Key Innovations

1. Intelligent Multi-Agency Coordination

Automatically notifies and coordinates Traffic Police, Ambulance Services, Road Maintenance, and Public Transport authorities from a single incident, eliminating manual communication delays.

Real-world Benefit: Faster emergency response and coordinated actions reduce incident resolution time and minimize traffic congestion.

2. Predictive Traffic Congestion Analysis

AI analyzes incident location, severity, and traffic conditions to identify congestion hotspots and recommend alternate routes before traffic worsens.

Real-world Benefit: Helps authorities proactively divert traffic, reducing commuter delays during peak hours.

3. Smart Resource Allocation & Dispatch

Automatically assigns the nearest available emergency and maintenance teams based on incident priority and location.

Real-world Benefit: Optimizes resource utilization, reduces response time, and accelerates road clearance.

4. Unified Smart Traffic Command Center

Provides a centralized operational workspace where all incidents, field updates, agency responses, and traffic conditions are monitored in real time.

Real-world Benefit: Enables city authorities to make faster, data-driven decisions through a single operational dashboard.

5. Predictive Traffic Infrastructure Maintenance

Monitors the health and maintenance history of traffic signals and infrastructure to identify potential failures before they disrupt traffic.

Real-world Benefit: Reduces unexpected signal failures, minimizes maintenance costs, and ensures smoother traffic operations.

Advantages

Traditional System	UrbanSync
Manual coordination between multiple agencies	Automated multi-agency workflows
Disconnected systems and fragmented data	Unified ServiceNow platform
Delayed incident response	Real-time incident management
Limited operational visibility	Live dashboards & AI-driven insights
Reactive traffic management	Intelligent, proactive traffic operations

Sequence Diagram

The sequence diagram illustrates the end-to-end interaction between citizens, the Traffic Management Centre (TMC), AI services, emergency response agencies, and the ServiceNow platform during a traffic incident. It demonstrates how incidents are reported, analyzed, prioritized, assigned to relevant agencies, monitored in real time, and resolved through automated workflows, ensuring seamless coordination and faster response across the urban traffic management ecosystem.

Step	Description
1. Report Incident	A citizen or commuter reports a traffic incident through the Service Portal or Mobile App.
2. Incident Registration	The system receives the request, and the TMC operator verifies and creates the incident record.
3. AI Assessment	The AI Engine analyzes the incident, determines severity, predicts impact, and recommends response actions.
4. Incident Prioritization	The incident is classified and prioritized based on AI insights and operational policies.
5. Resource Assignment	ServiceNow automatically dispatches the appropriate agencies, such as Traffic Police, Ambulance Services, Fire Department, Maintenance Team, and Public Transport Authority.
6. Response & Coordination	Assigned agencies acknowledge the request, execute their tasks, and continuously update the incident status.
7. Progress Monitoring	The TMC monitors the incident lifecycle, tracks field updates, and coordinates resources until resolution.
8. Incident Resolution	Once the situation is resolved, the incident is closed and citizens are notified of the completion.
9. Reporting & Analytics	Operational data is stored, and dashboards are updated with KPIs, reports, and performance metrics for future analysis.

System Architecture

The UrbanSync System Architecture follows a layered approach that enables seamless interaction between users, intelligent automation, workflow orchestration, operational management, analytics, and the ServiceNow platform. Each layer performs a specific function while working together to deliver real-time traffic incident management and multi-agency coordination.

1. Users Layer

Purpose: Provides role-based access to all stakeholders interacting with UrbanSync.

Modules:

- Citizens
- Traffic Police
- Field Officers
- Transport Operators
- Transport Commissioner

2. User Access Layer

Purpose: Offers multiple channels for users to access UrbanSync services.

Modules:

- Service Portal
- Now Mobile Application
- Virtual Agent

3. Intelligence Layer

Purpose: Enhances operational efficiency using AI-driven insights and decision support.

Modules:

- AI Incident Classification
- AI Assistant
- Predictive Alerts

4. Workflow Automation Layer

Purpose: Automates incident response, task routing, and stakeholder notifications.

Modules:

- Flow Designer
- Automated Workflows
- Notifications
- Task Escalation

5. Operations & Compliance Layer

Purpose: Manages operational activities while ensuring policy compliance and governance.

Modules:

- Document Management
- Compliance Monitoring
- Policy Management

6. Analytics & Reporting Layer

Purpose: Provides real-time visibility into traffic operations through dashboards and reports.

Modules:

- Performance Metrics
- Dashboards
- Reports & Insights

7. ServiceNow Platform Layer

Purpose: Acts as the core platform supporting application development, data management, integrations, and security.

Modules:

- App Engine Studio
- CMDB
- Integration Hub
- Access Control
- Audit Logs

Layered technical Stack

Layer	Brief Description
1. User / Persona Layer	Represents all stakeholders interacting with UrbanSync, including citizens, traffic police, transport operators, field officers, and the Transport Commissioner through role-based access.
2. Application Layer	Provides user-facing interfaces such as the Service Portal, TMC Command Workspace, Now Mobile, and Virtual Agent for incident reporting, monitoring, and operational management.
3. ServiceNow Platform Layer	Serves as the core application layer, leveraging App Engine Studio, Flow Designer, Major Incident Management, CMDB, Business Rules, and AI capabilities to automate traffic operations.
4. Data & Analytics Layer	Stores operational data using ServiceNow tables and CMDB while providing real-time dashboards, KPIs, and performance analytics for informed decision-making.
5. Integration Layer	Connects UrbanSync with external systems such as Maps APIs, CCTV feeds, IoT sensors, notification services, and emergency response agencies through secure REST-based integrations.
6. Infrastructure & Security Layer	Ensures a secure, scalable, and reliable platform using ServiceNow Cloud, role-based access control, encryption, audit logs, backup, and disaster recovery mechanisms.

Tools and Technologies

ServiceNow Technologies

Core Development

- **App Engine Studio** – Develop the custom Urban Traffic Management application.
- **Flow Designer** – Automate incident response and multi-agency workflows.
- **Service Portal** – Build the citizen-facing portal for reporting and tracking incidents.
- **Custom Tables** – Manage incidents, agencies, field teams, traffic assets, and transport disruptions.

- **Business Rules & Notifications** – Automate validations, alerts, and status updates.

Incident & Operations Management

- **Major Incident Management** – Coordinate and manage critical traffic incidents.
- **CMDB** – Maintain traffic signal and infrastructure asset information.

AI & Analytics

- **Virtual Agent / Now Assist (Generative AI)** – Assist operators and citizens with incident-related queries and guidance.
- **Performance Analytics** – Monitor KPIs, response times, congestion trends, and agency performance.

Testing

- Functional Testing
- User Acceptance Testing (UAT)
- Workflow Validation
- End-to-End Scenario Testing

Supporting Technologies

- **JavaScript** – Client Scripts, Business Rules, and Script Includes.
- **HTML & CSS** – Customize Service Portal pages.
- **Figma** – Design UI mockups and user interface prototypes.

Implementation Plan

UrbanSync follows a phased implementation approach, progressing from requirement analysis and application development to AI integration, testing, and final deployment. This structured methodology ensures the delivery of a scalable, reliable, and intelligent traffic management solution.

Phase	Duration	Key Activities	Deliverables
Phase 1: Requirement Analysis & Solution Design	Week 1	Analyze problem statement, identify stakeholders, define use cases, create workflow, architecture, database schema, UI wireframes	SRS, Workflow Diagram, Architecture, Custom Table Design
Phase 2: Core Application Development	Week 2	Develop Transport Operations App using App Engine Studio, create custom tables, forms, Service Portal, TMC Workspace, role-based access	Functional UrbanSync application with Incident Management
Phase 3: Workflow Automation & AI Integration	Week 3	Configure Flow Designer, Business Rules, Notifications, Decision Tables, Virtual Agent, Generative AI, Mobile Workspace	Automated multi-agency workflows and AI-assisted incident handling
Phase 4: Integration, Testing & Optimization	Week 4	Integrate CMDB, Performance Analytics, REST APIs (Maps/Notifications), perform unit testing, workflow testing, UAT, bug fixes	Fully tested application with dashboards and mobile functionality
Phase 5: Deployment, Documentation & Demo Preparation	Week 5	Final deployment, prepare presentation, demo scenario, user guide, architecture diagrams, pitch video	Ready-to-demo solution, documentation, final presentation

Development Methodology

Agile Development Methodology

UrbanSync follows an **Agile development approach**, enabling iterative development, continuous testing, and regular stakeholder feedback. The project is divided into five phases: requirement analysis, application development, workflow automation and AI integration, testing, and deployment. This methodology ensures flexibility, faster delivery of features, and continuous improvement throughout the project lifecycle.

Testing Strategy

UrbanSync employs a comprehensive testing strategy to ensure reliability, functionality, and performance.

- **Unit Testing:** Validate individual modules such as incident reporting, workflows, and dashboards.
- **Integration Testing:** Verify seamless interaction between ServiceNow modules, AI services, and external integrations.
- **User Acceptance Testing (UAT):** Ensure the solution meets operational requirements of all stakeholders.
- **Performance Testing:** Evaluate system responsiveness under multiple concurrent incidents.
- **Security Testing:** Validate role-based access control and data protection mechanisms.

Risks & Mitigation

As an intelligent traffic management platform, UrbanSync may encounter operational and technical challenges during implementation. To ensure a reliable and scalable solution, potential risks are identified early and addressed through appropriate mitigation strategies.

Risk	Mitigation Strategy
Delayed incident notifications	Implement automated workflows with real-time notifications using Flow Designer.
Incorrect AI recommendations	Keep AI as a decision-support tool with operator approval before execution.
Integration failures with external systems	Use standardized REST APIs and Integration Hub with fallback notification mechanisms.
High incident volume affecting performance	Optimize workflows, database indexing, and dashboard queries for scalability.
Unauthorized access to sensitive data	Implement role-based access control (RBAC), audit logs, and secure authentication.
Incomplete or incorrect incident reports	Use mandatory fields, AI-assisted validation, and operator verification before processing.

Expected Outcomes

UrbanSync is expected to transform the way metropolitan traffic authorities manage incidents by replacing fragmented communication and manual coordination with a unified, intelligent ServiceNow platform. The solution enables real-time collaboration between traffic police, emergency services, maintenance teams, and public transport authorities, ensuring faster response, improved operational visibility, and efficient resource utilization. By integrating AI-assisted decision support, workflow automation, and centralized monitoring, UrbanSync helps cities deliver safer roads, smoother traffic flow, and a better commuting experience while laying the foundation for future smart city initiatives.

Key Expected Outcomes

- **Accelerated Incident Response:** Automated workflows reduce the time required to detect, assign, and respond to traffic incidents, enabling quicker emergency assistance and road clearance.
- **Seamless Multi-Agency Collaboration:** Traffic Police, Ambulance Services, Fire Department, Road Maintenance, and Public Transport authorities operate through a single coordinated platform, eliminating communication delays.
- **Improved Traffic Flow:** Intelligent incident prioritization and route diversion recommendations help reduce congestion and restore normal traffic movement more efficiently.
- **Enhanced Public Safety:** Faster emergency response, timely notifications, and coordinated field operations contribute to safer roads and improved commuter protection.
- **Reliable Public Transport Operations:** Bus services can be rerouted promptly during road disruptions, minimizing delays and ensuring service continuity for commuters.
- **Data-Driven Decision Making:** Real-time dashboards and performance analytics provide city administrators with actionable insights to optimize traffic operations and resource allocation.
- **Greater Citizen Engagement:** Citizens can easily report incidents, receive live status updates, and stay informed about traffic conditions, improving transparency and trust in public services.
- **Scalable Smart City Foundation:** The modular architecture allows UrbanSync to support future enhancements such as predictive traffic management, smart traffic signals, IoT integration, and connected vehicle ecosystems.

Real-World Scenario

Consider a major accident occurring during peak morning traffic on a busy city corridor. With UrbanSync, the incident is reported through the Service Portal or by a field officer and immediately reaches the Traffic Management Centre. The system analyzes the severity, recommends response actions, and automatically notifies the Traffic Police, Ambulance Services, Road Maintenance Team, and Public Transport Authority. Bus routes are diverted, commuters receive real-time traffic alerts, and city officials monitor the incident through live dashboards. As field teams update progress using the Now Mobile application, the platform continuously tracks the response until the road is cleared and normal traffic flow is restored. This coordinated approach minimizes congestion, improves emergency response, and enhances the overall commuting experience.

Business Impact

UrbanSync delivers measurable business value by improving emergency response, optimizing city operations, and enhancing commuter experience through intelligent automation and real-time collaboration.

Key Business Impacts

- **Faster Emergency Response:** During a major road accident, UrbanSync simultaneously alerts Traffic Police, Ambulance Services, and Road Maintenance teams, reducing response delays and enabling faster road clearance.
- **Reduced Traffic Congestion:** When a key arterial road is blocked, the platform recommends alternate routes and initiates traffic diversions, helping restore normal traffic flow and reducing commuter delays.
- **Improved Public Transport Reliability:** If an accident disrupts a bus corridor, UrbanSync automatically notifies transport authorities and suggests alternate routes, ensuring passengers experience minimal service disruption.
- **Efficient Resource Utilization:** During multiple simultaneous incidents, the platform intelligently assigns the nearest available field officers and maintenance teams, improving operational efficiency and reducing response time.

- **Smarter Infrastructure Management:** When a traffic signal repeatedly reports faults, UrbanSync schedules preventive maintenance before a complete failure occurs, minimizing traffic disruptions and maintenance costs.
- **Real-Time Operational Visibility:** During city-wide events or emergencies, Transport Commissioners can monitor live incidents, agency responses, and traffic conditions through centralized dashboards, enabling faster and more informed decisions.
- **Enhanced Citizen Experience:** Citizens can report traffic incidents, receive live status updates, and access alternate route information, improving transparency, trust, and overall commuting experience.
- **Foundation for Smart Cities:** By integrating AI, automation, mobile operations, and analytics into one platform, UrbanSync provides a scalable foundation for future smart city initiatives such as connected vehicles, adaptive traffic signals, and predictive traffic management.

Future Enhancements

UrbanSync is designed as a scalable platform that can evolve with emerging smart city technologies, enabling intelligent traffic management and enhanced urban mobility.

AI-Based Traffic Prediction

- Predict congestion hotspots before they occur.
- Recommend proactive traffic diversions during peak hours.

Adaptive Smart Traffic Signals

- Adjust signal timings based on live traffic density.
- Reduce waiting time and improve intersection efficiency.

IoT & Smart Camera Integration

- Detect accidents and infrastructure failures automatically.
- Enable real-time monitoring through connected devices.

Connected Vehicle Integration

- Send live traffic alerts directly to connected vehicles.
- Improve navigation through dynamic route recommendations.

Drone-Assisted Incident Monitoring

- Provide aerial visibility during major incidents.
- Support faster damage assessment and emergency coordination.

Smart City Digital Twin

- Simulate traffic scenarios before implementation.
- Assist authorities in infrastructure planning and event management.

Predictive Infrastructure Maintenance

- Identify traffic signal failures before breakdowns occur.
- Schedule preventive maintenance using AI insights.

Integrated Disaster & Emergency Management

- Coordinate responses during floods, storms, or large public events.
- Enable unified communication across emergency agencies.

Team Structure

Role Assignment

Team Member	Primary Role
Rajalakshmi Kondoori	Team Lead, Solution Architect & ServiceNow Application Developer
Dammannagari Anjali	Workflow Automation & Backend Developer
Bobbili Chandana Sri	Service Portal & UI/UX Developer
Sharanya Padala	Integration & Mobile Developer
Devi Reddy Venkata Keerthana Reddy	QA, Analytics & Documentation Lead

Responsibility Matrix

Activity	Rajalakshmi	Anjali	Chandana	Sharanya	Keerthana
Requirement Analysis	✓	✓	✓	✓	✓
Solution Architecture	Lead	Support	Support	Support	Support
Database & Custom Tables	Lead	Support		Support	Support
App Engine Development	Lead	✓	Support	Support	✓
Flow Designer & Automation	Support	Lead		Support	✓
Business Rules & Notifications	Support	Lead		Support	✓
Service Portal Development	Support	Support	Lead	Support	✓
UI/UX Design	Support		Lead	Support	✓

Now Mobile Development	Support			Lead	Support
Testing & Bug Fixing	✓	✓	✓	✓	Lead
Performance Analytics	Support		Support	Support	Lead
Documentation	Support	Support	Support	Support	Lead

Expertise & Responsibilities

Rajalakshmi Kondoori

- Lead project planning and team coordination.
- Design the overall UrbanSync solution architecture.
- Develop the core application using App Engine Studio and Custom Tables.
- Coordinate module integration and lead the final project presentation.

Dammannagari Anjali

- Design and implement Flow Designer workflows.

- Configure Business Rules, Notifications, and backend automation.
- Support application development and testing activities.

Bobbili Chandana Sri

- Develop the Citizen Service Portal and UI components.
- Design responsive interfaces and user experience.
- Support portal testing and presentation preparation.

Sharanya Padala

- Develop REST API integrations and Integration Hub connections.
- Configure Now Mobile application features and external integrations.
- Support system integration testing and deployment.

Devi Reddy Venkata Keerthana Reddy

- Lead testing and quality assurance activities.
- Develop Performance Analytics dashboards and reports.
- Prepare project documentation and support the final demonstration.

Team Skill Mapping

Team Member	Role	Key Skills & Responsibilities
Rajalakshmi Kondoori	Team Lead, Solution Architect & ServiceNow Application Developer	Solution architecture, App Engine Studio, Custom Tables, project coordination
Dammannagari Anjali	Workflow Automation & Backend Developer	Flow Designer, Business Rules, backend automation, notifications
Bobbili Chandana Sri	Service Portal & UI/UX Developer	Service Portal, UI Builder, UI/UX design, responsive interfaces
Sharanya Padala	Integration & Mobile Developer	REST APIs, Integration Hub, Now Mobile, external integrations
Devi Reddy Venkata Keerthana Reddy	QA, Analytics & Documentation Lead	Testing, Performance Analytics, dashboards, documentation

Leadership & Coordination

Team Lead:

Name : Rajalakshmi Kondoori

Department : Computer Science and Engineering - Data Science

To ensure the successful execution of UrbanSync within the hackathon timeline, the team will adopt a structured and collaborative approach focused on effective planning, communication, and continuous improvement.

- **Project coordination** led by the Team Leader to oversee progress, task allocation, and milestone tracking.
- **Iterative development** following Agile principles, enabling continuous feature enhancement and rapid feedback incorporation.

- **Regular synchronization meetings** to review deliverables, resolve challenges, and maintain alignment across the team.
- **Collaborative development and knowledge sharing** to promote efficient problem-solving and consistent implementation practices.
- **Continuous validation and integration** of developed modules to ensure system stability and seamless functionality.
- **Collective preparation** of documentation, demonstrations, and presentation materials to deliver a compelling final solution

The Team

Rajalakshmi Kondoori
Role : Team Lead, Solution Architect & ServiceNow Application Developer

Dammannagari Anjali
Role : Workflow Automation & Backend Developer

Bobbili Chandana Sri
Role : Service Portal & UI/UX Developer

Devi Reddy Venkata Keerthana Reddy
Role : QA, Analytics & Documentation Lead

Sharanya Padala
Role : Integration & Mobile Developer

Conclusion

UrbanSync is a comprehensive ServiceNow-powered Urban Traffic and Public Transport Operations platform designed to transform traditional traffic management through intelligent automation, AI-assisted decision support, and real-time multi-agency collaboration. By unifying incident management, emergency response, infrastructure maintenance, public transport coordination, and citizen engagement within a single platform, UrbanSync addresses real-world urban mobility challenges with a scalable and practical solution. The proposed system not only enhances operational efficiency and public safety but also establishes a strong foundation for future smart city initiatives, making it a sustainable and impactful solution for modern metropolitan transport authorities.

UrbanSync - One City. One Platform. Endless Mobility.
